Overview

The combination of connecting a Raspberry Pi to COSM makes creating a internet of things much easier than it has been in the past. The Pi with it's easy access to ethernet / WiFi and COSM's drop dead simple usability will graph all sensor data you send to it.

This tutorial explains how to connect a analog temperature sensor to the Pi and use a small python script to upload that data for storage and graphing on COSM.

To follow this tutorial you will need

- [MCP3008 DIP-package ADC converter chip \(http://adafru.it/856\)](http://adafru.it/856)
- [Analog Temperature Sensor TMP-36 \(http://adafru.it/165\)](http://adafru.it/165)
- [Adafruit Pi Cobbler \(http://adafru.it/914\)](http://adafru.it/914) - follow the tutorial to assemble it
- [Half \(http://adafru.it/64\)](http://adafru.it/64) or [Full-size breadboard \(http://adafru.it/239\)](http://adafru.it/239)
- [Breadboarding wires \(http://adafru.it/aHz\)](http://adafru.it/aHz)
- Raspberry Pi with a internet connection

Connecting the Cobbler to the MCP3008 and TMP36

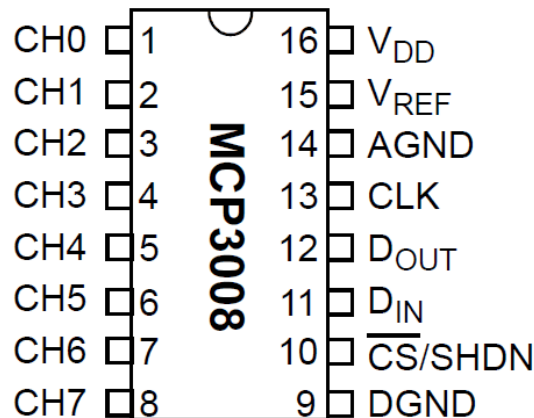

Why we need an ADC

The Raspberry Pi computer does not have a way to read analog inputs. It's a digital-only computer. Compare this to the Arduino, AVR or PIC microcontrollers that often have 6 or more analog inputs! Analog inputs are handy because many sensors are analog outputs, so we need a way to make the Pi analog-friendly.

We'll do that by wiring up an [MCP3008 chip \(http://adafru.it/856\)](http://adafru.it/856) to it.

The [MCP3008 \(http://adafru.it/856\)](http://adafru.it/856) acts like a 'bridge' between digital and analog. It has 8 analog inputs and the Pi can query it using 4 digital pins. That makes it a perfect addition to the Pi for integrating simple sensors like [photocells \(http://adafru.it/aHA\)](http://adafru.it/aHA), [FSRs \(http://adafru.it/aHC\)](http://adafru.it/aHC) or potentiometers, [thermistors \(http://adafru.it/aHD\)](http://adafru.it/aHD), etc.!

[Let's check the datasheet of the MCP3008 chip. \(http://adafru.it/aHE\)](http://adafru.it/aHE) On the first page in the lower right corner there's a pinout diagram showing the names of the pins.

Wiring Diagram

In order to read analog data we need to use the following pins: **VDD** (power), **DGND** (digital ground) to power the MCP3008 chip. We also need four 'SPI' data pins: **DOUT** (Data Out from MCP3008), **CLK** (Clock pin), **DIN** (Data In from Raspberry Pi), and **/CS** (Chip Select). Finally of course, a source of analog data, we'll be using the TMP36 temperature sensor

The MCP3008 has a few more pins we need to connect: **AGND** (analog ground, used sometimes in precision circuitry, which this is not) connects to **GND**, and **VREF** (analog voltage reference, used for changing the 'scale' - we want the full scale so tie it to **3.3V**)

Below is a wiring diagram. Connect the 3.3V cobbler pin to the left + rail and the GND pin to the right - rail. Connect the following pins for the MCP chip

- MCP3008 VDD -> 3.3V (red)
- MCP3008 VREF -> 3.3V (red)
- MCP3008 AGND -> GND (green)
- MCP3008 CLK -> #18
- MCP3008 DOUT -> #23
- MCP3008 DIN -> #24

- MCP3008 CS -> #25
- MCP3008 DGND -> GND (green)

Advanced users may note that the Raspberry Pi does have a hardware SPI interface (the cobbler pins are labeled MISO/MOSI/SCLK/CE0/CE1). The hardware SPI interface is super fast but not included in all distributions. For that reason we are using a bit banded SPI implementation so the SPI pins can be any of the raspberry pi's GPIOs (assuming you update the script).

TMP36

Finally the TMP36 has three pins that need to be connected. They are numbered from left to right in ascending order when the text of the sensor is facing you.

- pin1: 3.3v
- pin2: analog out --> channel0 on mcp3008 (pin1)
- pin3: gnd

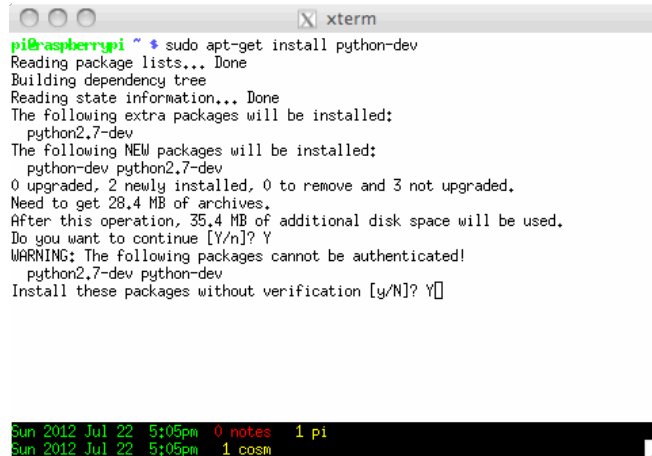

Necessary Packages

This guide is based on Debian's "Wheezy" release for Raspberry Pi. It was made available in Mid July 2012. The following items must be installed in order to utilize the Raspberry Pi's GPIO pins and to upload data to COSM.

Add the latest dev packages for Python (2.x)

```
$ sudo apt-get install python-dev
```

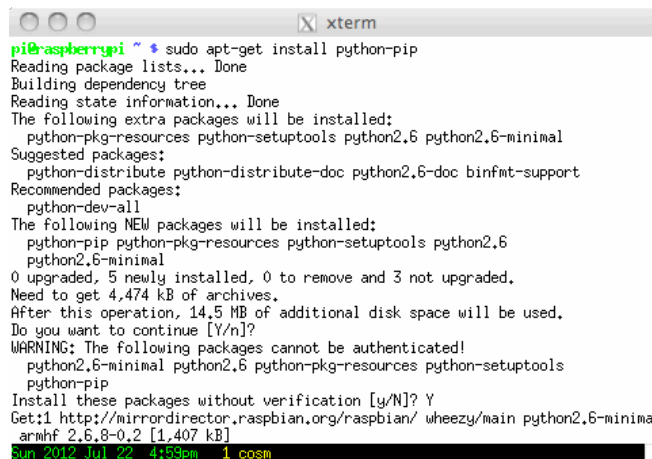

```
pi@raspberrypi ~$ sudo apt-get install python-dev
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following extra packages will be installed:
  python2.7-dev
The following NEW packages will be installed:
  python-dev python2.7-dev
0 upgraded, 2 newly installed, 0 to remove and 3 not upgraded.
Need to get 28.4 MB of archives.
After this operation, 35.4 MB of additional disk space will be used.
Do you want to continue [Y/n]? Y
WARNING: The following packages cannot be authenticated!
  python2.7-dev python-dev
Install these packages without verification [y/N]? Y
```

Upgrade distribute (required for RPi.GPIO 0.3.1a) - [No image for this one]

```
$ sudo easy_install -U distribute
```

Install python-pip (Pip Installs Packages, python packages)

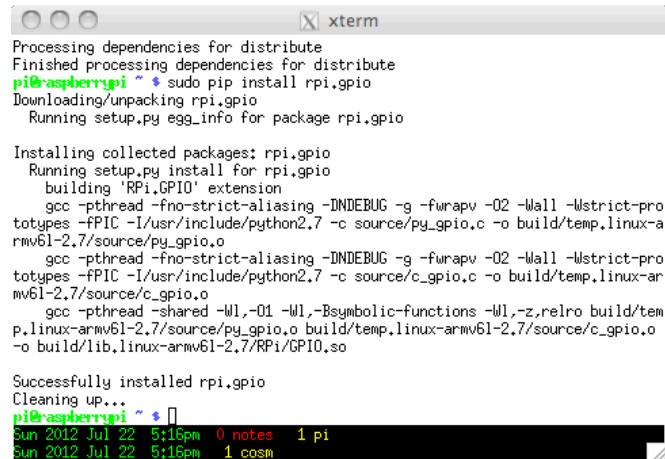

```
$ sudo apt-get install python-pip
```

```
pi@raspberrypi ~$ sudo apt-get install python-pip
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following extra packages will be installed:
  python-pkg-resources python-setuptools python2.6 python2.6-minimal
Suggested packages:
  python-distribute python-distribute-doc python2.6-doc binfmt-support
Recommended packages:
  python-dev-all
The following NEW packages will be installed:
  python-pip python-pkg-resources python-setuptools python2.6
  python2.6-minimal
0 upgraded, 5 newly installed, 0 to remove and 3 not upgraded.
Need to get 4,474 kB of archives.
After this operation, 14.5 MB of additional disk space will be used.
Do you want to continue [Y/n]? Y
WARNING: The following packages cannot be authenticated!

COSM Account and Feed

COSM (used to be Pachube) helps connect little devices like the raspberry pi to the internet. You will need to do the following to use COSM.

- Setup a Account
- Create a Feed
- Save the API_KEY
- Save the FEED ID

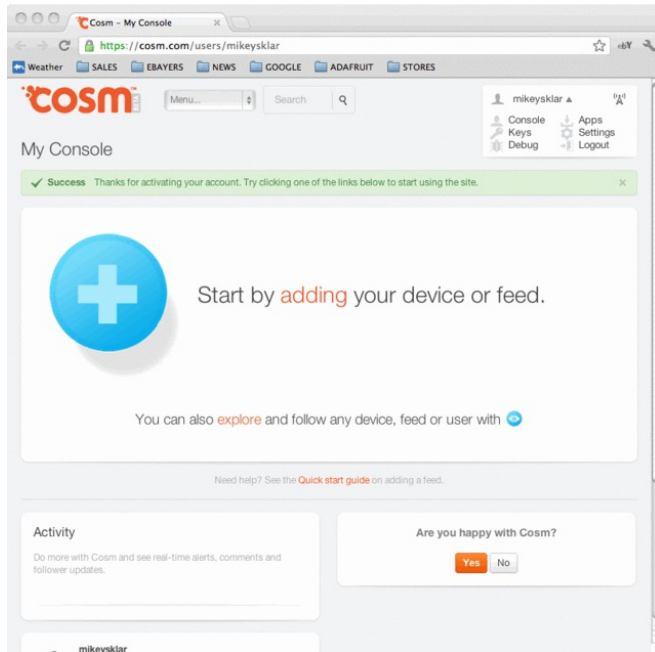

Setup a Account

You will need to create a COSM account. Click on the blue "Get Started" circle to create a new account. It's your typical e-mail/password followed by password verification. You will need to check your e-mail and click the verification link.

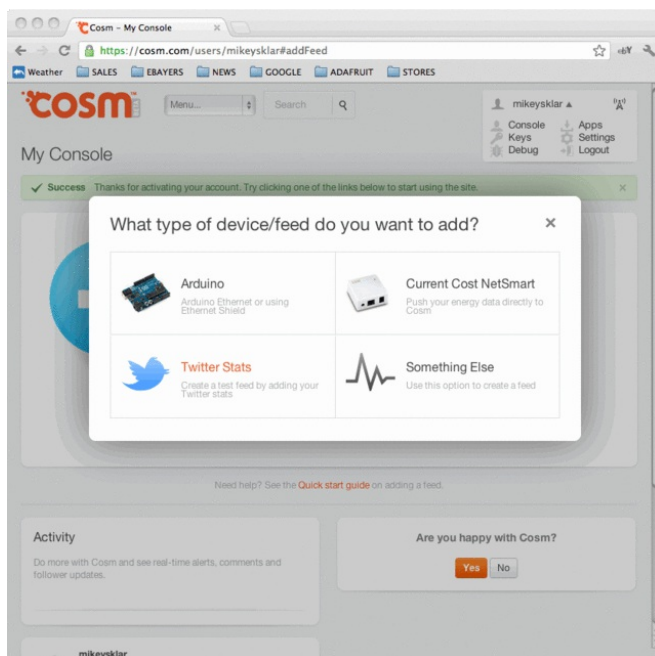

Add a Feed

Click the blue plus to add a feed.

Select Arduino

Give your new feed a title and tags.

Title: "Raspberry Pi Temperature" (or whatever you like)
Tags: raspberry pi, temperature, adc (or make up your own)

Select the "Create" button.

Python Script

The Code

This 100+ line python script can be pasted into a editor and saved on your raspberry pi.

The script is fairly simple. Half of the code (the **readadc** function) is a function that will 'talk' to the MCP3008 chip using four digital pins to 'bit bang' the SPI interface (this is because not all Raspberry Pi's have the hardware SPI function).

The MCP3008 is a 10-bit ADC. That means it will read a value from 0 to 1023 ($2^{10} = 1024$ values) where 0 is the same as 'ground' and '1023' is the same as '3.3 volts'. We don't convert the number to voltage although its easy to do that by multiplying the number by $(3.3 / 1023)$.

Every 30 seconds we:

- read the adc value on channel 0 (temperature sensor)
- convert the adc value to millivolts: **millivolts = read_adc0 * (3300.0 / 1023.0)**
- convert the millivolts value to a celsius temperature: **temp_C = ((millivolts - 100.0) / 10.0) - 40.0**
- convert the celsius temperature to a fahrenheit temperature: **temp_F = (temp_C * 9.0 / 5.0) + 32)**
- then send the data up to pachube to be saved and graphed

```
#!/usr/bin/env python
import time
import os
import RPi.GPIO as GPIO
import eeml

GPIO.setmode(GPIO.BCM)
DEBUG = 1
LOGGER = 1

# read SPI data from MCP3008 chip, 8 possible adc's (0 thru 7)
def readadc(adcnun, clockpin, mosipin, misopin, cspin):
    if ((adcnun > 7) or (adcnun < 0)):
        return -1
    GPIO.output(cspin, True)

    GPIO.output(clockpin, False) # start clock low
    GPIO.output(cspin, False)    # bring CS low

    commandout = adcnun
    commandout |= 0x18 # start bit + single-ended bit
    commandout <= 3    # we only need to send 5 bits here
    for i in range(5):
        if (commandout & 0x80):
            GPIO.output(mosipin, True)
        else:
            GPIO.output(mosipin, False)
        commandout <= 1
        GPIO.output(clockpin, True)
        GPIO.output(clockpin, False)

    adcout = 0
```

```

# read in one empty bit, one null bit and 10 ADC bits
for i in range(12):
    GPIO.output(clockpin, True)
    GPIO.output(clockpin, False)
    adcout <= 1
    if (GPIO.input(misopin)):
        adcout |= 0x1

GPIO.output(cspin, True)

adcout /= 2      # first bit is 'null' so drop it
return adcout

# change these as desired - they're the pins connected from the
# SPI port on the ADC to the Cobbler

Feeds and Keys

Update the API_KEY and FEED values to the ones that COSM provided you.

```

pi@raspberrypi: ~
# COSM variables. The API_KEY and FEED are specific to your COSM account.
# They must be changed.
#
#API_KEY = '5RND03ShYJxYiq2V2sgSRtz3112SAKxvFQjNDQmNxc0RSsz0g'
#FEED = 68872
API_KEY = 'YOUR_API_KEY'
FEED = YOUR_FEED_ID
API_URL = '/v2/feeds/{feednum}.xml'.format(feednum = FEED)

# temperature sensor connected channel 0 of mcp3008
adcnum = 0

while True:
    # read the analog pin (temperature sensor LM35)
    read_adc0 = readadc(adcnum, SPICLK, SPIMOSI, SPIMISO, SPICSS)

    # convert analog reading to millivolts = ADC * ( 3300 / 1024 )
    millivolts = read_adc0 * ( 3300.0 / 1024.0)

    # 10 mv per degree
    temp_C = millivolts / 10.0

```

Run it!

Now that you have the code modified with your keys, go ahead and make the file executable.

```
$ chmod +x adafruit-cosm-temp.py
```

Run the script. With DEBUG = 1 (default) you will see of the adc0 value, millivolts, celsius and fahrenheit on sent to your terminals STDOUT. These same values are also being sent up to COSM.

```
$ sudo ./adafruit-cosm-temp.py
```

```
pi@raspberrypi: ~  
pi@raspberrypi ~$ sudo ./adafruit-cosm-temp.py  
read_adc0: 114  
millivolts: 367  
temp_C: 36.7  
temp_F: 98.1  
  
[]  
  
Tue 2012 Jul 24 8:31pm 0 src 1 run
```

If you're having python crash due to an unstable internet connection, check out this handy thread over at CoSM <http://community.cosm.com/node/114>

COSM Graph View

This is how COSM displays the temperature we are sending it (<http://adafru.it/aNa>). We can see both celsius and fahrenheit temperature graphs. The graphs have independent sliders so it can easily be adjusted from minutes to weeks to months. There are a lot of fun settings for viewing the graph data.

A really cool feature is that you can have triggers go off based on the data values. COSM will alert you via HTTP POST or Twitter so that you can setup alarms if things go bad. If we connected up more sensors the MCP3008 we could easily have more graphs appear.
